

To ensure you get the absolute best out of your new pedal, we strongly recommend you take some time just playing with it to get to know the controls and how they react. Yes, that is right, we want you to play with it as much as possible!

Boost level control provides up to +22dB of level with added side remote 1/4" jack for channel switching with a mini slide switch. There is no need to tap dance, if you want one channel on your amp boosted and the other not, the 33® changes the channel on your amp and automatically applies the boost.

BYPASS - True Bypass footswitch.

LEVEL - The mental control - increase this to drive the front end of your amp harder. The more you increase it, the more your tone will start to jump out of your amp. Don't be afraid to tweak the amp controls when your amp is reacting the way you want it to - with this level of boost, sneaky frequencies and harmonics may start to appear... make your sound your own.

POWER - 9-12vDC center pin negative (fully regulated) external adapter/power supply only. Power draw **27mA**

**Remember, you may not need the amount of gain you thought you needed. You will find that you need much less gain than you thought!*

Setting suggestions
These are only suggestions - find your own tone, as these may not apply to your guitar, your amp or your fingers - use them as a starting point...

Mid level push

This is the point that your amp will start to feel really different, the strings will start to bounce under your fingers and the first signs that the chug is incoming will start to appear...

Tight-ass face melting mayhem

The full 33® chugfest is ready and open for business. No-one is safe...
